Register-transfer-level abstraction is used in hardware description languages (HDLs) like Verilog and VHDL to create high-level representations of a circuit, from which lower-level representations and ultimately actual wiring can be derived. Design at the RTL level is typical practice in modern digital design.

Before continuing, you should have a basic understanding of digital logic and have already installed a Verilog platform of some form. In my case, I am using the Altera DE1 FPGA development board. The DE1 comes equipped with several switches and LEDs which we use to provide inputs and outputs for our circuits.
